

am PhD Pedagogy. My Doctoral Thesis was about Gender Violence and selfcontrol at University of Deusto (Bilbao-Spain). Rosa Santibañez and Ioseba Iraurgi were my thesis directors. I have just won The best Thesis about gender violence and selfcontrol in Spain by Ministerio de Sanidad, Servicios Sociales e Igualdad. I sent you a brief abstract about my research: The objective of this study was to adapt the Shapiro Control Inventory (Shapiro, 1994) into Spanish and to validate it. A sample of 116 women was used, 51 of them (43.9%) victims of gender-based violence, and confirmatory factorial analysis was used to validate the structure of the SCI as well as its ability to discriminate between the perception of control, the desire for control and agents of control among women who are victims of violence compared with women who do not present this condition. There was an adequate internal consistency of scales: sense of positive control (Alpha = .86), sense of negative control (.70) and desire for control (.71) and an adjustment of the structural model of scales of sense of positive control (GFI = .97; CFI = .99; RMSEA = .035), sense of negative control (GFI = .99; CFI = .99; RMSEA = .009) and sense of overall control (GFI = .92; CFI = .94; RMSEA = .064). It was also noted how women who are victims of gender-based violence have a greater sense of negative control and less self-control. On the other hand, women not exposed to the situation of abuse, presented higher levels of sense of overall control. In conclusion, the version of the SCI adapted into Spanish presented metrical characteristics of consistency, structure and discriminating capacity which makes it an appropriate instrument for the assessment of the construct of control both in the general population and in groups affected by emotional disturbance.

4. Reading from the manual, scoring. I want to confirm some of the calculations.
- i) To calculate the overcontrol score, we obtain the mean of Q5, Q10, Q28, Q34 and Q35. Right? YES!
 - ii) To calculate the selfcontrol score, we obtain the mean of Q33, Q34 and Q137. Right? IF YOU ARE TALKING ABOUT THE DATA ON P. 106 OF THE MANUAL, THAT IS ONLY QUESTION 137. THAT IS ALL WE USED;
 - iii) But Q33 & Q34 are on the 7 point Likert scale whereas Q137 is on the 4 point Likert scale. Does this matter in the calculation? GOOD POINT.

AGAIN, WE ONLY USED THE SINGLE ITEM ON TABLE 45-46 IN MANUAL.

• *Self-control*

... self-control is not part of the four modes (you'll see in the manual we looked at it independently. So good work. The student received your

I'm in the process of setting up an Access database for scoring the SCI. I notice that items #137 and #187 regarding "Self-control" are not involved in any of the scales or related scorings, according to my list of instructions. Am I missing something?

MORE ON AGENCY OF CONTROL

iv) For agency of control, score of others as agents is the mean of Q19, 21, 22, 23 and score of self as agent is mean of Q20. Right? NOT QUITE. WE KEEP AGENCY OF CONTROL--OTHER--AS A SINGLE ITEM (SEE PAGE 121, FIGURE 19) IT IS A SINGLE ITEM; THEN, WE BREAK OUT THE SPECIFIC AREAS OF AGENCY AS A FAMILY, GOVERNMENT, HIGHER POWER. WE DON'T CREATE A MEAN NUMBER CALLED "OTHER")
